- chapter:2

2.5 The Subatomic Particles: Protons, Neutrons and Electrons in Atoms

Elements: are composed of extremely small particles called **atoms**.

Atom: is the basic unit of an element that can enter into chemical combination.

Atom consist of:

1. Electron (e) (-ve charge)
2. Proton (p) (+ve charge)
3. Neutron (n) (neutral)

2.5 The Subatomic Particles: Protons, Neutrons and Electrons in Atoms

Properties of Subatomic Particles						
Name	Location	Charge (C)	Unit Charge	Mass (amu)	Mass (g)	Symbol
Electron	Outside nucleus	-1.602×10^{-19}	1-	0.00055	0.00091×10^{-24}	e , e ⁻
Proton	Nucleus	1.602×10^{-19}	1+	1.00727	1.67262×10^{-24}	P , P ⁺ , H ⁺
Neutron	Nucleus	0	0	1.00866	1.67493×10^{-24}	n , n ⁰

The number of protons

located in an atom's nucleus determines the element's identity

Atomic number: is the number of protons in the nucleus of each atom of an element.

Atomic number (Z) = number of protons in nucleus.

For a neutral atom: Number of protons = number of electrons

Mass number: is the total number of neutrons and protons present in the nucleus of an atom of an element

Mass number (A) = atomic number (Z) + number of neutrons

Thus: the number of neutrons = A - Z

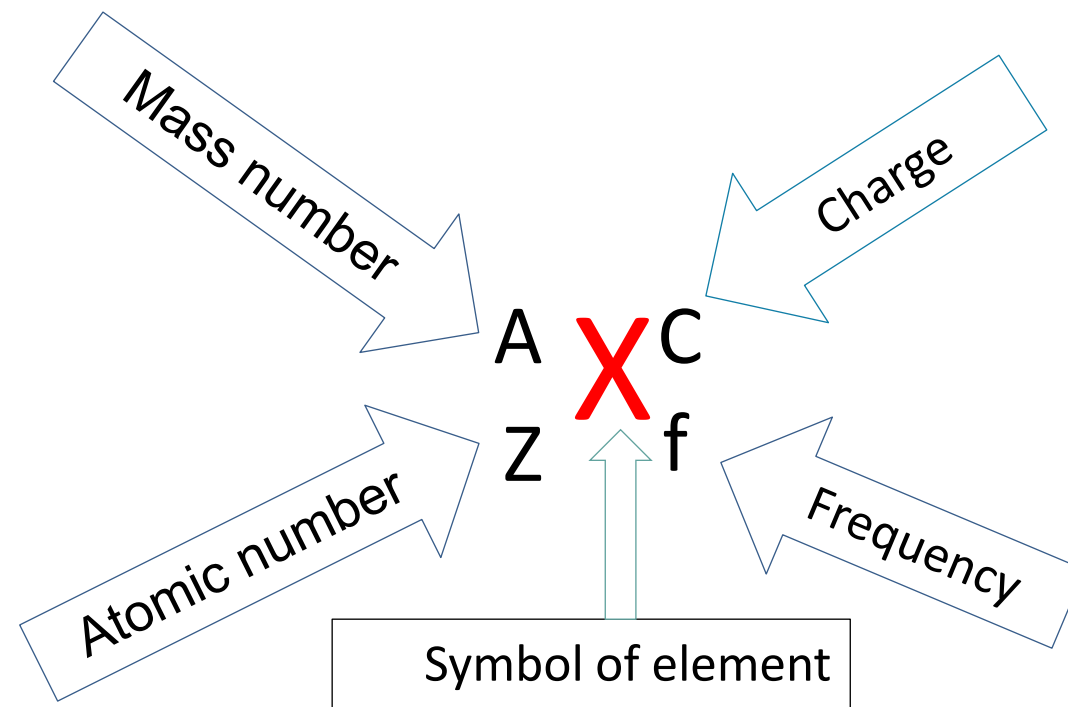

- The letter c in the chemical symbol (${}^A_ZX_f^c$) represents:

a- Atomic number

b- mass number

c- charge

d- frequency

Exercise

How many protons, electrons, and neutrons are in the following atoms:

protons

electrons

neutrons

32
S
16

65
Cu
29

240
U
92

Note: Neutral atoms are having the same number of **electrons** as **protons**!

Give the number of protons, neutrons, and electrons in each of the following species:

Elements	${}^{20}_{11}\text{Na}$	${}^{22}_{11}\text{Na}$	${}^{17}_8\text{O}$	${}^{14}_6\text{C}$	${}^{200}_{80}\text{Hg}$
Atomic Number (Z)					
Mass Number (A)					
No. of electrons (e)					
No. of protons (p)					
No. of neutrons (n)					

Examples

1-How many protons, neutrons, and electrons are in

6 protons, $8 = (14 - 6)$ neutrons, 6 electrons

2-How many protons, neutrons, and electrons are in

6 protons, $5 = (11 - 6)$ neutrons, 6 electrons

Ions: Losing and Gaining Electrons

- **The Ion:**

- is an atom or group of atoms carrying a positive (+) or negative (-) charge.

- Taking away

- an electron from an atom gives a Cation with a positive charge.

- More protons in nucleus vs. electrons surrounding nucleus

- Metals tend to form cations.

- Adding

- an electron to an atom gives an Anion with a negative charge.

- Fewer protons in the nucleus vs. electrons surrounding nucleus

- Nonmetals tend to form anions.

Ion

Cation:

an ion with a +ve charge

(lose electron/s)

Anion:

an ion with a -ve charge

(Gain electron/s)

Elements: Defined by their Number of Protons

1-How many protons and electrons are in ${}_{13}^{27}\text{Al}^{3+}$?

13 protons, 10 (13 – 3) electrons

2-How many protons and electrons are in ${}_{34}^{78}\text{Se}^{2-}$?

34 protons, 36 (34 + 2) electrons

Use the following table and choose which of the species are positively charged?

Atom or ion element	I	II	III	IV	V
Atom or ion electrons (e)	8	13	8	8	11
Atom or ion protons (p)	6	10	8	10	12
Atom or ion neutrons (n)	6	11	9	7	10

A. III and V

C. II and III

B. **IV and V**

D. I and VI

	A	Z	n	p	e
${}_{12}^{24}\text{Mg}^{+2}$					
${}_{15}^{31}\text{P}^{-3}$					
${}_{1}^1\text{H}$					

1. Which of the following expressions represents two molecules of water?

- A. H_2O
- B. H_2O_2
- C. $2 \text{H}_2\text{O}$
- D. 2HO_2

2. The species S^{2-} , F^- , and Cl^- are all...

- A. cations
- B. anions
- C. isotopes
- D. Halogens

3. Atoms with the same number of electrons and number of protons are called...

- A. ions
- B. isotopes
- C. neutral atoms
- D. different atoms

Isotopes

are **atoms of one element** that have the **same number of protons** (atomic number) and **different number of neutrons**. Isotopes differ in mass number because they have different number of neutrons. **Isotopes are chemically identical.**

Mass Number (A) = Protons + Neutrons

Note: Isotopes are identified by their “mass numbers”

(e.g. C-12 , C-13 , C-14)

c: An Example

	$^{12}_6\text{C}$	$^{13}_6\text{C}$	$^{14}_6\text{C}$
protons:	6 p ⁺	6 p ⁺	6 p ⁺
neutrons:	6 n	7 n	8 n
electrons:	6 e ⁻	6 e ⁻	6 e ⁻

Isotopes :

Are different forms of atoms of the same element have the same number of protons (atomic number) but differ in the number of neutrons.

	chlorine Isotopes			Sodium isotopes			Hydrogen isotopes		
	Cl_{17}^{37}	Cl_{17}^{36}	Cl_{17}^{35}	Na_{11}^{23}	Na_{11}^{24}	Na_{11}^{22}	H_1^1	H_1^2	H_1^3
A	37	36	35	23	24	22	1	2	3
Z	17	17	17	11	11	11	1	1	1
n	20	19	18	12	13	11	0	1	2
p	17	17	17	11	11	11	1	1	1
e	17	17	17	11	11	11	1	1	1

Isobars :

Are the different elements with same mass number but different atomic number (number of protons)

	Isobars : الأيزوباترات				
	K_{19}^{40}	Ca_{20}^{40}		C_6^{14}	N_7^{14}
A	40	40		14	14
Z	19	20		6	7
n	21	20		8	7
p					
e					

Isotones :

Different elements have the same number of neutrons.

	Isotones : الأيزوتونات				
	Mg_{12}^{24}	Na_{11}^{23}		Zr_{40}^{85}	Sr_{38}^{83}
A					
Z					
n	12	12		45	45
p					
e					

Which of the following pairs are isobars , isotones , isotopes

Assessment

Answer the following questions:

1- Fill in the blanks to complete the table:

Symbol	Z	A	Number of p	Number of e ⁻	Number of n	Charge
_____	8	_____	_____	_____	8	2-
Ca ²⁺	20	_____	_____	_____	20	_____
Mg ²⁺	_____	25	_____	_____	13	2+
N ³⁻	_____	14	_____	10	_____	_____

Answer the following questions:

2- Determine the number of p^+ , n^0 , and e^- in each atom:

3- Determine the number of protons and the number of electrons in each ion:

- 4- Write isotopic symbols of the form A_ZX for each isotope:**
- the copper isotope with **36** neutrons
 - the oxygen isotope with **8** neutrons
 - the aluminum isotope with **14** neutrons
 - the iodine isotope with **74** neutrons

2.6 Finding Patterns: The Periodic Law and The Periodic Table

- In 1869, Dmitri Mendeleev arranged
- the elements on his table in order of increasing atomic mass.
- He found that some properties of those elements recurred in a “periodic pattern”.

Mendeleev's Periodic Table (1869)

I	II	III	IV	V	VI	VII	VIII		
H 1.01									
Li 6.94	Be 9.01	B 10.8	C 12.0	N 14.0	O 16.0	F 19.0			
Na 23.0	Mg 24.3	Al 27.0	Si 28.1	P 31.0	S 32.1	Cl 35.5			
K 39.1	Ca 40.1		Ti 47.9	V 50.9	Cr 52.0	Mn 54.9	Fe 55.9	Co 58.9	Ni 58.7
Cu 63.5	Zn 65.4			As 74.9	Se 79.0	Br 79.9			
Rb 85.5	Sr 87.6	Y 88.9	Zr 91.2	Nb 92.9	Mo 95.9		Ru 101	Rh 103	Pd 106
Ag 108	Cd 112	In 115	Sn 119	Sb 122	Te 128	I 127			
Ce 133	Ba 137	La 139		Ta 181	W 184		Os 194	Ir 192	Pt 195
Au 197	Hg 201	Tl 204	Pb 207	Bi 209					
			Th 232			U 238			

To be periodic means to Exhibit a repeating pattern.

Looking for Patterns: Recurring Properties

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
H	He	Li	Be	B	C	N	O	F	Ne	Na	Mg	Al	Si	P	S	Cl	Ar	K	Ca

- The color of each element represents its properties.
- We arrange them in rows so that similar properties align in the same vertical columns.

1																	2		
H																	He		
3	4	5	6	7	8	9	10												
Li	Be	B	C	N	O	F	Ne												
11	12	13	14	15	16	17	18												
Na	Mg	Al	Si	P	S	Cl	Ar												
19	20																		
K	Ca																		

- **Mendeleev** : summarized these observations in the periodic law:

The Periodic Law: When the elements are arranged in order of **increasing mass**; certain sets of properties recur periodically.

- **Mendeleev** : arranged the rows so that elements with similar properties fall in the same vertical columns.

Mendeleev arranged elements in the periodic table according to:

- A. number of protons
- B. number of electrons
- C. mass
- D. volume

The Modern Periodic Table

- In 1913, **Henry Moseley** proposed the modern periodic table using
- atomic number instead of atomic mass, as the organizing principle for all the identified elements.
- **The Modern Periodic Table Consists of:**
 - **7 Rows:** are referred to as **Periods**, the periods are numbered 1–7.
 - **18 Columns:** are sometimes referred to as **Groups** or **Families**,
 - they are numbered 1–18 (or the A and B grouping).
 - They are commonly called “**Families**” because the elements within the column have similar physical and chemical properties.

- Elements in the periodic table are classified
- into the following three major divisions:
 - Metals
 - Nonmetals
 - Metalloids

The Modern Periodic Table: Metals, Nonmetals & Metalloids

Major Divisions of the Periodic Table

Metals
 Metalloids
 Nonmetals

1A 1		2A 2		3B 3		4B 4		5B 5		6B 6		7B 7		8B 8		9B 9		10B 10		11B 11		12B 12		3A 13		4A 14		5A 15		6A 16		7A 17		8A 18		
1	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	36

	Th	Pa	U	Np	Pu	Am	Cm	Bk	Cf	Es	Fm	Md	No	Lr

➤ Properties of Metals:

➤ Metals lie on the lower left side and middle of the periodic table.

✓ They are good conductors of heat and electricity.

✓ All metals are solids at room temperature, except mercury (Hg) is a liquid.

✓ They can be pounded into flat sheets (malleability).

✓ They can be drawn into wires (ductility).

✓ They are often shiny.

✓ They tend to lose electrons when they undergo chemical changes (forming cations).

• About 75% of the elements in the periodic table are metals.

Classification of Elements: **Nonmetals**

- **Nonmetals** lie on the upper right side of the periodic table.
- **Properties of Nonmetals:**
 - ✓ Poor conductors of heat and electricity.
 - ✓ Can be found in all three states of matter (gases, liquids & solids).
 - ✓ Nonmetals with Solid state are brittle (not ductile and not malleable).
 - ✓ They tend to gain electrons when they undergo chemical changes (forming anions).

- **Metalloids** are elements that lie along the zigzag line that divides metals and nonmetals in the periodic table.
- **Properties of Metalloids:**
 - ✓ Can exhibit mixed properties of both metals and nonmetals.
 - ✓ Solids at room temperature.
 - ✓ Known as **semiconductors** for electricity.
 - ✓ Poor conductors of heat.

The Modern Periodic Table: Main-group Elements & Transition Elements

Main-group elements		Transition elements										Main-group elements														
1A		2A		3B			4B		5B		6B		7B		8B		9B	10B	11B	12B	13A	14A	15A	16A	17A	18A

© 20

- **Main-group elements** (groups with letter **A**): their properties are **largely predictable**.
- **Transition elements** or transition metals (groups with letter **B**): their properties are **less predictable**.

Major Families: Alkali Metals (Group 1A)

- **The group 1A** elements, called the **alkali metals**, are all **highly reactive** metals.

- A marble-sized piece of sodium explodes violently when dropped into water.

Lithium, potassium, and rubidium are also alkali metals.

Li
Na
K
Rb
Cs

Alkali metals

Major Families: Alkaline Earth Metals (Group 2A)

- The group **2A** elements are called the
- **alkaline earth metals**.
- They are **fairly reactive**,
- but not quite as reactive as the alkali metals (group 1A).
 - Calcium, for example, reacts fairly vigorously with water.
 - Other alkaline earth metals include magnesium
 - (a common low-density structural metal), strontium, and barium.

The diagram shows a portion of the periodic table with the elements of Group 2A highlighted in orange. The elements listed are Be, Mg, Ca, Sr, Ba, and Ra. A callout box labeled 'IIA' points to the column containing these elements.

Be			
Mg			
Ca			
Sr			
Ba			
Ra			

Major Families: Halogens (Group 7A)

- The group **7A** elements, the **halogens**, are **very reactive** nonmetals.
- They are always found in nature as a salt.
- **Chlorine**, a greenish-yellow gas with a pungent odor
- **Bromine**, a red-brown liquid that easily evaporates into a gas
- **Iodine**, a purple solid
- **Fluorine**, a pale-yellow gas

Halogens

F
Cl
Br
I
At

Ions and the Periodic Table

- **A main-group metal**
- tends to lose electrons, forming a cation
- with the same number of electrons as the nearest noble gas.
- **A main-group nonmetal**
- tends to gain electrons, forming an anion
- with the same number of electrons as the nearest noble gas.

➤ For the main-group elements

that form cations with predictable charge,

the charge is equal to the group number:

(for example: sodium, Na, of group 1A, forms the cation Na^{1+}).

➤ For the main-group elements

that form anions with predictable charge,

the charge is equal to the group number minus eight:

(for example: nitrogen, N, of group 5A, forms the anion N^{3-}).

➤ Transition elements: may form different ions with variable charges:

✓ (for example: iron (Fe) can form the cations: Fe^{2+} or Fe^{3+}

✓, also copper (Cu) can form the cations: Cu^{1+} or Cu^{2+}).

Ions and the Periodic Table

- In general, the charge of ions of main-group elements can be predicted from their group number:
- The alkali metals (group 1A): tend to lose one electron to form **+1 ions**.
- The alkaline earth metals (group 2A): tend to lose two electrons to form **+2 ions**.
- The halogens (group 7A): tend to gain one electron to form **-1 ions**.
- The oxygen family nonmetals (group 6A): tend to gain two electrons to form **-2 ions**.

Ions and the Periodic Table

Elements that form ions with predictable charges:

1A	2A	Transition metals form cations with various charges										3A	4A	5A	6A	7A	8A
Li ⁺	Be ²⁺													N ³⁻	O ²⁻	F ⁻	
Na ⁺	Mg ²⁺												Al ³⁺		S ²⁻	Cl ⁻	
K ⁺	Ca ²⁺												Ga ³⁺		Se ²⁻	Br ⁻	
Rb ⁺	Sr ²⁺												In ³⁺		Te ²⁻	I ⁻	
Cs ⁺	Ba ²⁺																

2.7 Atomic Mass: The Average Mass of an Element's Atoms

- **Atomic mass** is sometimes called “**atomic weight**”.
- The atomic mass of each element is written directly with the element's symbol in the periodic table.
- It represents the average mass of all the isotopes that compose that element, weighted according to the natural abundance (fraction) of each isotope.

2.7 Atomic Mass: How to calculate?

➤ In general, the atomic mass can be calculated using the equation:

$$\begin{aligned}\text{Atomic mass} &= \sum_n (\text{fraction of isotope } n) \times (\text{mass of isotope } n) \\ &= (\text{fraction of isotope 1} \times \text{mass of isotope 1}) \\ &+ (\text{fraction of isotope 2} \times \text{mass of isotope 2}) \\ &+ (\text{fraction of isotope 3} \times \text{mass of isotope 3}) + \dots\end{aligned}$$

$$\text{➤ } A_m = A_{m1} \cdot P_1 + A_{m2} \cdot P_2 + \dots$$

Note: the fraction of each isotope = its natural abundance (%) / 100

➤ **Exercise:**

- Naturally occurring chlorine consists of 75.77% chlorine-35 atoms (mass 34.97 amu) and 24.23% chlorine-37 atoms (mass 36.97 amu).

Calculate the atomic mass of chlorine.

➤
$$A_m = A_{m1} \cdot P_1 + A_{m2} \cdot P_2 + \dots$$

• **Answer:**

The Atomic Mass of Cl = $26.4968 + 8.9578 = 35.45$ amu

2.7 Atomic Mass: Example

Copper has two naturally occurring isotopes: **Cu-63** with mass 62.9396 amu and a natural abundance of 69.17%, and **Cu-65** with mass 64.9278 amu and a natural abundance of 30.83%. Calculate the atomic mass of copper.

Solution

Convert the percent natural abundances into decimal form by dividing by 100.

$$\text{Fraction Cu-63} = \frac{69.17}{100} = 0.6917$$

$$\text{Fraction Cu-65} = \frac{30.83}{100} = 0.3083$$

calculate the atomic mass using the equation given in the text.

$$\begin{aligned} \text{Atomic mass} &= 0.6917(62.9396 \text{ amu}) + 0.3083(64.9278 \text{ amu}) \\ &= 43.5353 \text{ amu} + 20.0172 \text{ amu} = 63.5525 = 63.55 \text{ amu} \end{aligned}$$

- . What information would you need to calculate the average atomic mass of an element?
 - A) The number of neutrons in the element.
 - B) The atomic number of the element.
 - C) The mass and abundance of each isotope of the element.
 - D) The position in the periodic table of the element.

Iodine has two isotopes ^{126}I and ^{127}I , with the equal abundance. Calculate the average atomic mass of Iodine ($_{53}\text{I}$).

- A) 126.5 amu
- B) 35.45 amu
- C) 1.265 amu
- D) 71.92 amu

The atomic masses of ${}^6\text{Li}$ and ${}^7\text{Li}$ are 6.0151 amu and 7.0160 amu, respectively. Calculate the natural abundance of these two isotopes. The average atomic mass of Lithium ($\text{Li}=6.941$ amu).

- A) ${}^6\text{Li}= 7.49\%$, ${}^7\text{Li}= 92.51\%$
- B) ${}^7\text{Li}= 7.49\%$, ${}^6\text{Li}= 92.51\%$
- C) ${}^6\text{Li}= 8.49\%$, ${}^7\text{Li}= 95.51\%$
- D) ${}^7\text{Li}= 7.22\%$, ${}^6\text{Li}= 82.51\%$

(Ex:) - An element consists of two isotopes of masses 10.02 and 11.02 u and abundances 25 and 75%, respectively. The atomic mass of this element be:

a) 10.77

b) 21.04

c) 10.5

d) 1.077

Solutions :-

$$A_m = A_{m1} \cdot P_1 + A_{m2} \cdot P_2$$

$$A_m = \left(10.02 \times \frac{25}{100} + 11.02 \times \frac{75}{100} \right) = 10.77 \text{ u}$$

(Ex:)-the element oxygen consists of three isotopes ^{16}O , ^{17}O , ^{18}O the atomic mass of oxygen is 15.999 amu .Which isotope is more abundant?

a- ^{16}O

b- ^{17}O

c- ^{18}O

d-all the same

Solutions :-

$$A_{m1}=16$$

$$A_{m2}=17$$

$$A_{m3}=18$$

$$A_m=15.999$$

The nearest mass to atomic mass is 16 So the isotope ^{16}O is more abundant

Assessment

Answer the following questions:

1- Element X has three isotopes (see the table), the atomic mass of this element is _____ amu.

Isotope	Abundance	Mass
^{53}X	25.00	52.62
^{56}X	37.00	56.29
^{58}X	38.00	58.31

Assessment

Answer the following questions:

2- Which pairs of elements do you expect to be similar? Why?

- a. N and Ni
- b. Mo and Sr
- c. Ar and Kr
- d. Cl and I
- e. P and As

3- Determine whether or not each element is a main-group element:

- a. tellurium
- b. potassium
- c. vanadium
- d. manganese

Assessment

Answer the following questions:

4- Predict the charge of the monoatomic ion formed by each element:

- a. O b. K c. Al d. Rb e. N

5- Using a copy of the periodic table, write the name of each element and classify it as a metal, nonmetal, or metalloid:

- a. Na b. Mg c. Br d. N e. As

6- Using a copy of the periodic table, classify each element as an alkali metal, alkaline earth metal, halogen, or noble gas:

- a. sodium b. iodine c. calcium d. barium e. krypton

2.8 Molar mass: Counting Atoms by Weighing Them

- **Mole (mol)** is the SI unit of the amount of substance.
- **Avogadro's Number (N_A):**
- one mole of each substance contains **6.022×10^{23} particles**
 - (atoms or molecules or ions etc.).

Thus **6.022×10^{23}** is the Avogadro's Number (N_A)

$$1 \text{ mol} = N_A = 6.0221367 \times 10^{23}$$

=Dozen = 12

1 dozen = 12 Anything

1 mol = 6.022×10^{23} particles

➤ Chemistry is quantitative in nature

• **The Mole as a unit vs. “Dozen” as an unit:**

- The unit “dozen” is associated with 12 units.
- The unit “mole” is associated with 6.022×10^{23} particles.

• **There is Avogadro’s number of particles in every mole of substance:**

- 6.022×10^{23} particles is known as Avogadro’s number.
- 1 mole = 6.022×10^{23} particles.

• **1 mole of Cu atoms has:**

- an atomic mass of 63.55 g, which contains: 6.022×10^{23} Cu atoms.

- **Formula Mass (amu):** The mass of an individual molecule or formula unit, expressed in “amu” (atomic mass unit)
 - ✓ also known as molecular mass or molecular weight.
 - ✓ Sum of the masses of the atoms in a single molecule or formula unit

Formula mass of H₂O = [2 × (1.01 amu H)] + [1 × (16.00 amu O)] = 18.02 **amu**

$$\text{Formula mass} = \left(\begin{array}{c} \text{Number of atoms} \\ \text{of 1st element in} \\ \text{chemical formula} \end{array} \times \begin{array}{c} \text{Atomic mass} \\ \text{of} \\ \text{1st element} \end{array} \right) + \left(\begin{array}{c} \text{Number of atoms} \\ \text{of 2nd element in} \\ \text{chemical formula} \end{array} \times \begin{array}{c} \text{Atomic mass} \\ \text{of} \\ \text{2nd element} \end{array} \right) + \dots$$

Molar Mass (g/mol): The mass of one mole of a substance, expressed in “g/mol” •

Molar mass is numerically equal to formula mass, but expressed in g/mol •

Molar mass of H₂O = 18.02 g/mol

• **Molar mass (M):** the mass (in g or kg) of one mole of a substance;

$$M = \text{mass/mol} = \text{g/mol}$$

$$\text{For 1 MOLE: 1 amu} = 1 \text{ g}$$

e.g. The atomic mass of ¹²C is 12.00 amu = 12.00 g

1 mole of ¹²C = 12.00 amu = 12.00 g = has 6.022 x 10²³ (N_A) atoms

• Thus:

The Molar Mass (M) of ¹²C = 12.00 g/mol

Molar Mass (g/mol) = Atomic Mass (amu)

Examples:

1. The atomic mass of Na = 22.99 amu

The molar mass of Na = 22.99 g/mol

Element	(Formula mass)	(M_m) Molar Mass
Na	23 amu	23 g/mole
H	1 amu	1 g/mole from atoms
H ₂	2 amu	2 g/mole from molecules
Fe	56 amu	56 g/mole
Al	27 amu	27 g/mole

Compound	Formula mass	M_m. Molar Mass
H ₂ O	$1 \times 2 + 16 \times 1 = 18 \text{ amu}$	18 g/mole
NaOH	$23 \times 1 + 16 \times 1 + 1 \times 1 = 40 \text{ amu}$	40 g/mole
CH ₃ OH	$12 \times 1 + 1 \times 3 + 16 \times 1 \times 1 + 1 = 32 \text{ amu}$	32 g/mole
H ₂ CO ₃	$1 \times 2 + 12 \times 1 + 16 \times 3 = 62 \text{ amu}$	62 g/mole

(Ex-)-What is the molar mass of Na_2SO_4 ?

(a) 134 g/mole

(b) 148 g/mole

(c) 158 g/mole

(d) 142 g/mole

(Ex-)-What is the molar mass of nicotine, $\text{C}_{10}\text{H}_{14}\text{N}_2$?

(a) 134 g/mole

(b) 148 g/mole

(c) 158 g/mole

(d) 162 g/mole

(Ex-)-What is the molar mass of H_2SO_4 ?

(a) 134 g/mole

(b) 148 g/mole

(c) 158 g/mole

(d) 98 g/mole

(Ex:) -Penicillin is $\text{C}_{16}\text{H}_{18}\text{N}_2\text{O}_4\text{S}$. What is the molecular weight of penicillin?

✓ Exercises: Calculate the molar mass (g/mole) for each substance:

- **MgBr₂**
- **CuF₂**
- **Ca₃(PO₄)₂**
- **Ozone gas (O₃)**
- **Nitrogen gas**
- **(NH₄)₂SO₄**
- **C₈H₁₈**
- **Al₂(CO₃)₃**

Moles-mass-molecules

Conversions in Stoichiometry Calculations

The relations between amounts

n = number of moles

m = mass (atom or molecule)

M = molar mass (atomic mass or molecular mass)

What is the relation between them?

$$n = \frac{m}{M} = \frac{g}{g / mol} = mol$$

n = number of moles

N = number of atoms or molecules

N_A = Avogadro's number

(atoms or molecules/mol)

What is the relation between them?

$$n = \frac{N}{N_A} = \frac{\text{atoms (or molecules)}}{\text{atoms (or molecules) / mol}} = mol$$

Example:

How many moles of He atoms are in 6.46 g of He?

Solution:

- Number of moles = n
- **The atomic mass of He = The Molar mass of He**
- **From the periodic Table:**

The atomic mass of He = The molar mass of He = 4.003 g/mol

Thus: 4.003 g \rightarrow 1 mole of He

6.46 g \rightarrow ? moles of He

Thus: there is **1.61 moles of He atoms in 6.46 g of He**

How many the amount (in moles) of He atoms are in 6.46 g of He?

$$n(\text{He}) = \frac{m}{M} = \frac{6.46\text{g}}{4.003\text{g/mol}} = 1.61\text{mol}$$

Example: How many S atoms are in 16.3 g of S?

$$n(\text{S}) = \frac{m}{M} = \frac{16.3\text{g}}{32.07\text{g/mol}} = 0.508\text{mol}$$

$$n(\text{S}) = \frac{N}{N_A} \Rightarrow$$

$$N = n \times N_A$$

$$= 0.508\text{mol} \times 6.022 \times 10^{23}\text{ atoms/mol}$$

$$= 3.06 \times 10^{23}\text{ atoms}$$

Assessment

- 1- How many **moles** of H_2O are there in **100 g** H_2O ?
- 2- Calculate the number of iron **atoms** present in a **4 g** piece of iron.

3- How many **CO molecules** are there in **2.67 moles** of **CO**?

4- How many **moles** of **NH₃** are there in **0.2 Kg** of **NH₃**?

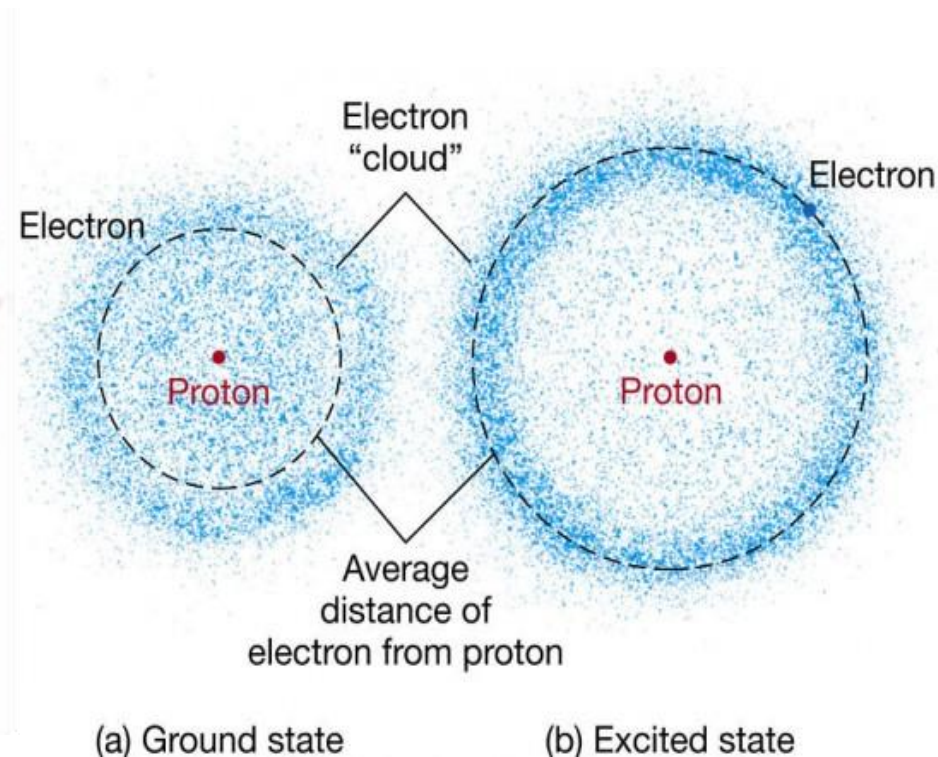

5- What is the **mass (g)** of 4.3×10^{24} **atoms** of silver?

6- Calculate the number of oxygen **molecules** in **250 g** oxygen.

7- What is the **mass (g)** of 9.2×10^{23} **particles** of $\text{Al}_2(\text{CO}_3)_3$?

2.9- Orbitals and Quantum Numbers

- **Niels Bohr's Model:** the electrons move in spherical orbits at fixed distances from the nucleus (similar to structure of the solar system).
- **Erwin Schrödinger** develops mathematical equations to describe the motion of electrons in atoms. His work leads to the electron cloud model.

➤ According to Quantum Mechanics:

Electron location around the atom's nucleus is described by the

four quantum numbers:

- n (principle energy level)
- l (orbital type: $s, p, d, f...$)
- m_l (orientation of orbital)
- m_s (spin of electron in orbital)

➤ Principal Quantum Number, n

- The principal quantum number,

n , describes the energy level on which the orbital resides.

- The values of n are integers > 0

$$n = 1, 2, 3, 4, 5, 6, 7$$

2.9- Orbitals and Quantum Numbers

➤ Angular momentum Quantum Number, l

- This quantum number defines the shape of the orbital.
- Allowed values of l are integers ranging from 0 to $n - 1$.
- We use letter designations to communicate the different values of l and, therefore, the shapes and types of orbitals.

Value of l	0	1	2	3
Type of orbital	<i>s</i>	<i>p</i>	<i>d</i>	<i>f</i>

2.9- Orbitals and Quantum Numbers

➤ Magnetic Quantum Number, m_l

- Describes the three-dimensional orientation of the orbital.
- Values are integers ranging from $-l \leq m_l \leq l$

$$m_l = -l, (-l+1), (-l+2), \dots, -2, -1, 0, 1, 2, \dots, (l-1), (l-2), +l$$

➤ Spin Quantum Number, m_s

- It designates the direction of the electron spin
- and may have a spin of $+1/2$, represented by \uparrow , or $-1/2$, represented by \downarrow .
- The significance of the electron spin quantum number is its determination of an atom's ability to generate a magnetic field or not.

Ex-)-Which one of the following sets of quantum numbers is not possible?

	n	l	m_l	m_s
Row 1	4	3	-2	+1/2
Row 2	3	0	1	-1/2
Row 3	3	0	0	+1/2
Row 4	2	1	1	-1/2
Row 5	2	0	0	+1/2

A. Row 1

B. Row 2

C. Row 3

D. Row 4

E. Row 5

Electrons in an orbital with $l = 3$ are in a

- A. d orbital.
- B. f orbital.
- C. g orbital.
- D. p orbital.
- E. s orbital

- Which of the following sets of quantum numbers refers to a 3p orbital?

a- $n = 3, l = 0, m_l = 0, m_s = + 1/2$

b- $n = 3, l = 1, m_l = -1, m_s = + 1/2$

c- $n = 3, l = 2, m_l = 1, m_s = + 1/2$

d- $n = 3, l = 3, m_l = -2, m_s = + 1/2$

Which of the following sets of quantum numbers refers to a 2s orbital?

a- $n = 1, l = 2, m_l = 2, m_s = + 1/2$

b- $n = 1, l = 2, m_l = 1, m_s = + 1/2$

c- $n = 2, l = 2, m_l = 0, m_s = + 1/2$

$n = 2, l = 0, m_l = 0, m_s = + 1/2$

-How many orbitals have the following quantum numbers: $n = 6$, $l = 2$, $m_l = -2$?

a- 0

b- 1

c- 3

d- 6

The lowest energy state of an atom is referred to as its

- a) bottom state.
- b) **ground state.**
- c) fundamental state.
- d) original state.

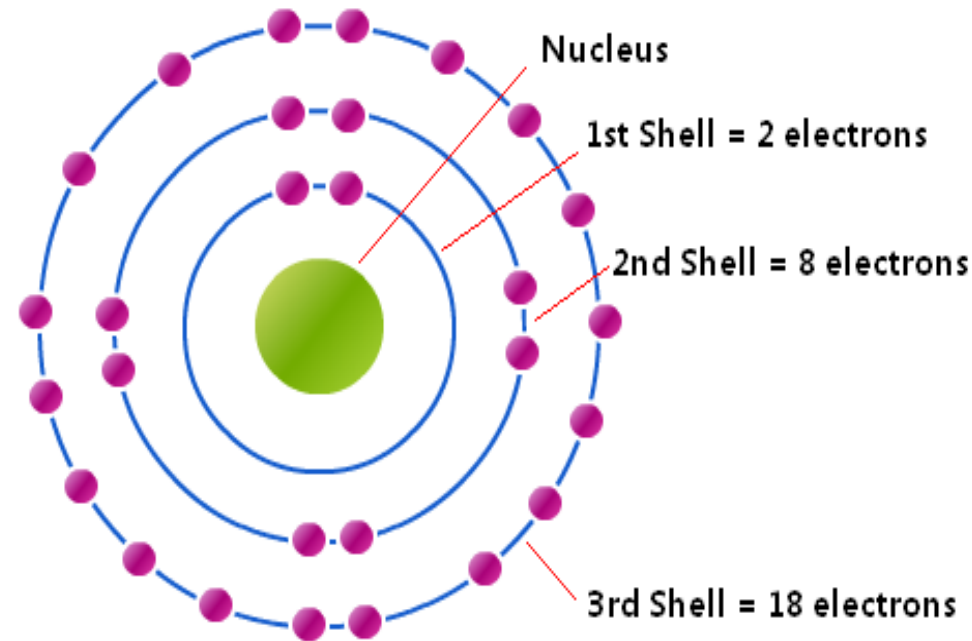

All s orbitals are

- a) shaped like four-leaf clovers.
- b) dumbbell-shaped.
- c) **spherical.**
- d) triangular.

2.10. Electron Configuration:

Electron configuration:

is how the electrons are distributed among the various atomic orbitals in an atom.

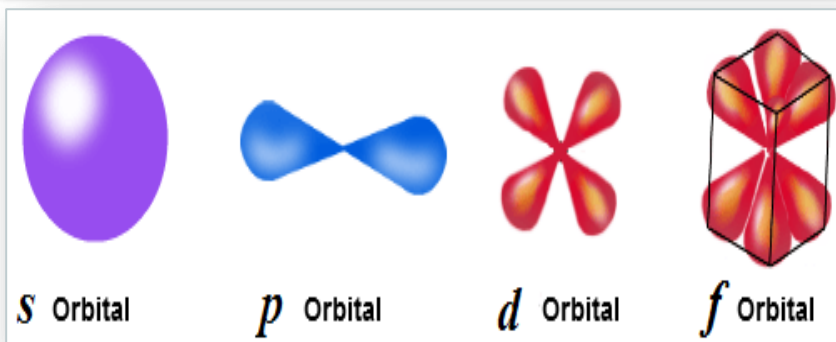

2.10- Electron Configuration: *s, p, d and f* Sublevels

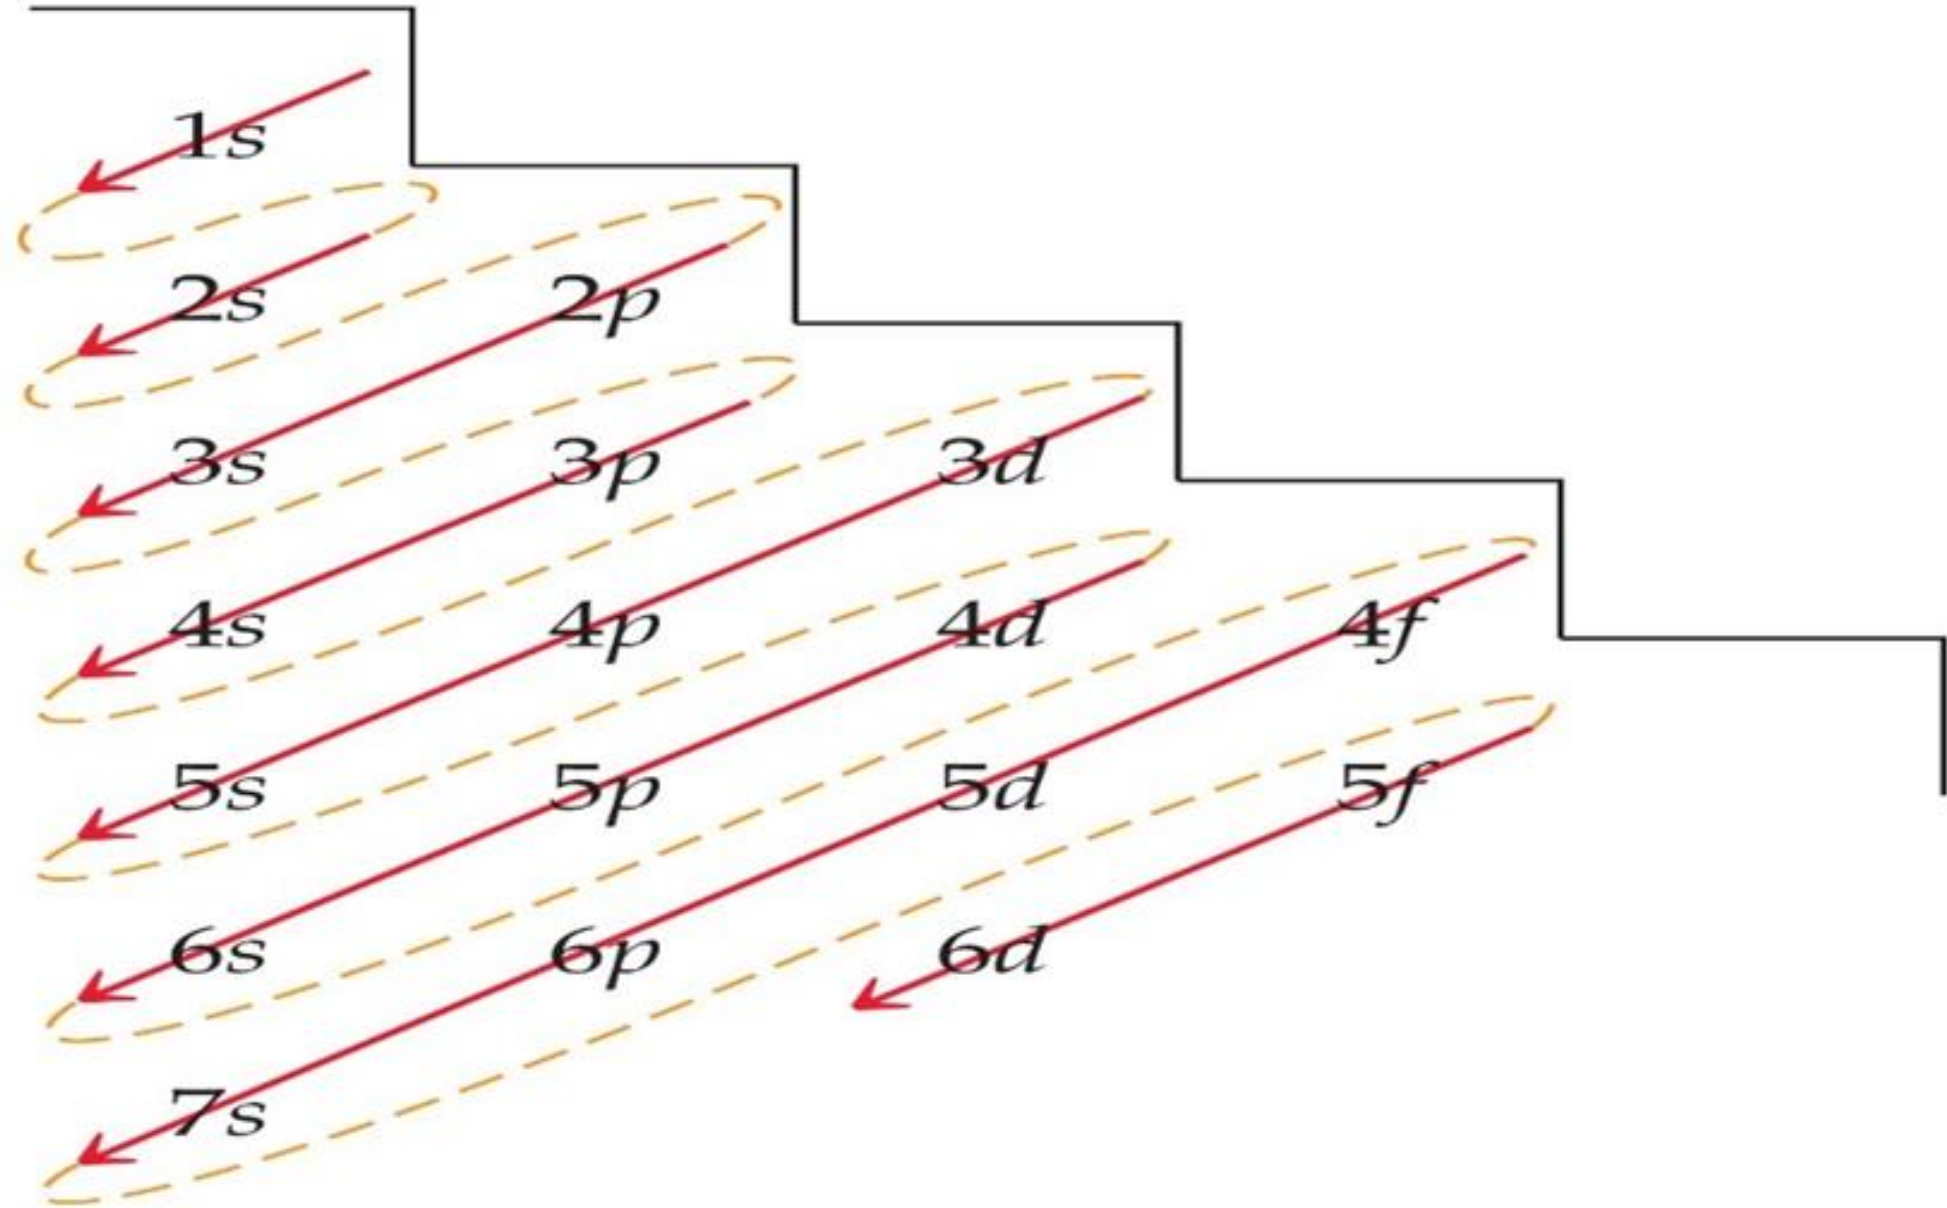

- **The number of orbitals and maximum number of electrons in each sublevel:**
- ✓ Each **orbital** in any sublevel is able to hold a maximum of **2 electrons**:
 - The ***s*** sublevel has only one orbital and can therefore hold only 2 electrons.
 - The ***p*** sublevel has three orbitals and can therefore hold 6 electrons.
 - The ***d*** sublevel has five orbitals and can therefore hold 10 electrons.
 - The ***f*** sublevel has seven orbitals and can therefore hold 14 electrons.
- ✓ The maximum number of electrons that can occupy a specific energy level can be calculated using the following formula:

where ***n*** = the principal quantum number (the number of the energy level).

$$\text{Electron Capacity} = 2n^2$$

2.10- Electron Configuration: Shapes of *s*, *p*, *d* & *f* orbitals

9. What is the maximum number of orbitals described by the quantum numbers: $n = 3$ $l = 2$

- a) 1
- b) 3
- c) **5**
- d) 9

10. What is the maximum number of orbitals described by the quantum numbers: $n = 4$

- a) 7
- b) 14
- c) **32**
- d) 48

11. The maximum number of electrons that can occupy an energy level described by the principal quantum number, n , is

- a) $n + 1$
- b) $2n$
- c) **$2n^2$**
- d) n^2

1-Aufbau Principle (“Fill up” electrons):

the electrons are added one by one to the atomic orbitals in lowest energy orbitals.

2-The Pauli Exclusion Principal:

NO two electrons in an atom can have the same set of four quantum numbers.

3-Hund’s Rule:

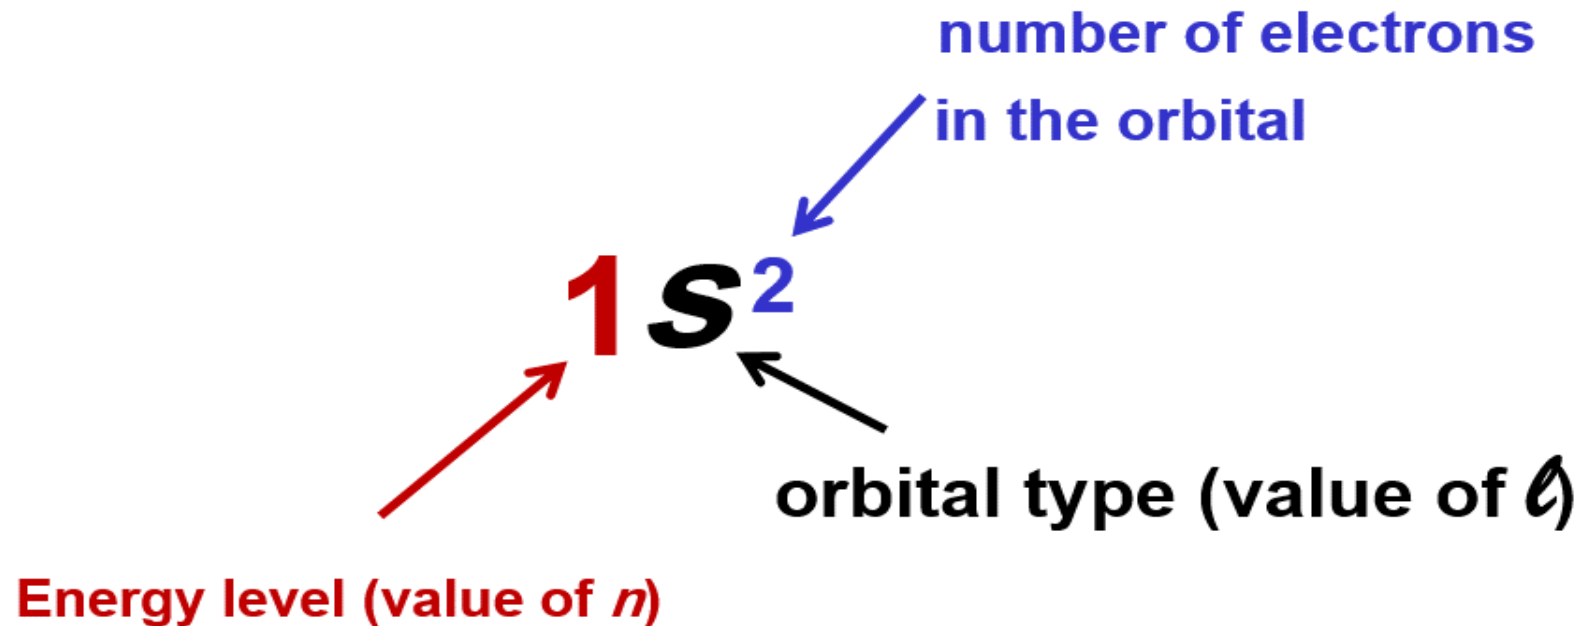

The most stable arrangement of electrons in subshells is the one with the greatest number of parallel spins.

Electron Configurations: Ordering of Orbital Filling

General Energy Ordering of Orbitals for Multielectron Atoms

Example: the electron configuration for He, atomic number = 2

2.10 Electron Configurations: Representing The Electron Configurations of Atoms

Example: The four quantum numbers for each of the two electrons in helium atom:

	Electron Configuration	Orbital diagram
He	$1s^2$	 $1s$

n	l	m_l	m_s
1	0	0	$+\frac{1}{2}$
1	0	0	$-\frac{1}{2}$

- **Rules of the aufbau principle** (aufbau: is a German word meaning “building”):
1. Lower-energy orbitals fill before higher-energy orbitals.
 2. An orbital can hold only two electrons,
which must have opposite spins (**Pauli exclusion principle**).
 1. If two or more degenerate orbitals are available, follow **Hund’s rule**.

Hund’s Rule:

when filling degenerate orbitals, the electrons fill them singly first, with parallel spins.

Electron Configurations: Examples

Lithium (Li) has an atomic number of 3, so to be neutral it must have 3 electrons: ➤

Electron configuration

Orbital diagram

➤ Carbon (C) has an atomic number of 6, so to be neutral it must have 6 electrons:

Electron configuration

Orbital diagram

Writing Orbital Diagrams

Write an orbital diagram for sulfur and determine the number of unpaired electrons.

Example: Write the electron configuration for the following elements:

Mg, P, Br, and Al

Electron Configurations: Examples

Electron Configurations of the First Ten Elements

	Electron Configurations		Orbital Box Diagrams				
	<i>Condensed</i>	<i>Expanded</i>	1s	2s	2p		
H	$1s^1$		↑				
He	$1s^2$		↑↓				
Li	$1s^2 2s^1$		↑↓	↑			
Be	$1s^2 2s^2$		↑↓	↑↓			
B	$1s^2 2s^2 2p^1$		↑↓	↑↓	↑		
C	$1s^2 2s^2 2p^2$	$1s^2 2s^2 2p^1 2p^1$	↑↓	↑↓	↑	↑	
N	$1s^2 2s^2 2p^3$	$1s^2 2s^2 2p^1 2p^1 2p^1$	↑↓	↑↓	↑	↑	↑
O	$1s^2 2s^2 2p^4$	$1s^2 2s^2 2p_x^2 2p^1 2p^1$	↑↓	↑↓	↑↓	↑	↑
F	$1s^2 2s^2 2p^5$	$1s^2 2s^2 2p^2 2p^2 2p^1$	↑↓	↑↓	↑↓	↑↓	↑
Ne	$1s^2 2s^2 2p^6$	$1s^2 2s^2 2p^2 2p^2 2p^2$	↑↓	↑↓	↑↓	↑↓	↑↓

. A possible set of quantum numbers for the last electron added to complete an atom of sodium Na in its ground state is

- a) $n = 3$, $l = 1$, $m_l = 0$, $m_s = \frac{1}{2}$
- b) $n = 3$, $l = 0$, $m_l = 0$, $m_s = \frac{1}{2}$
- c) $n = 2$, $l = 1$, $m_l = -1$, $m_s = \frac{1}{2}$
- d) $n = 2$, $l = 0$, $m_l = -1$, $m_s = \frac{1}{2}$

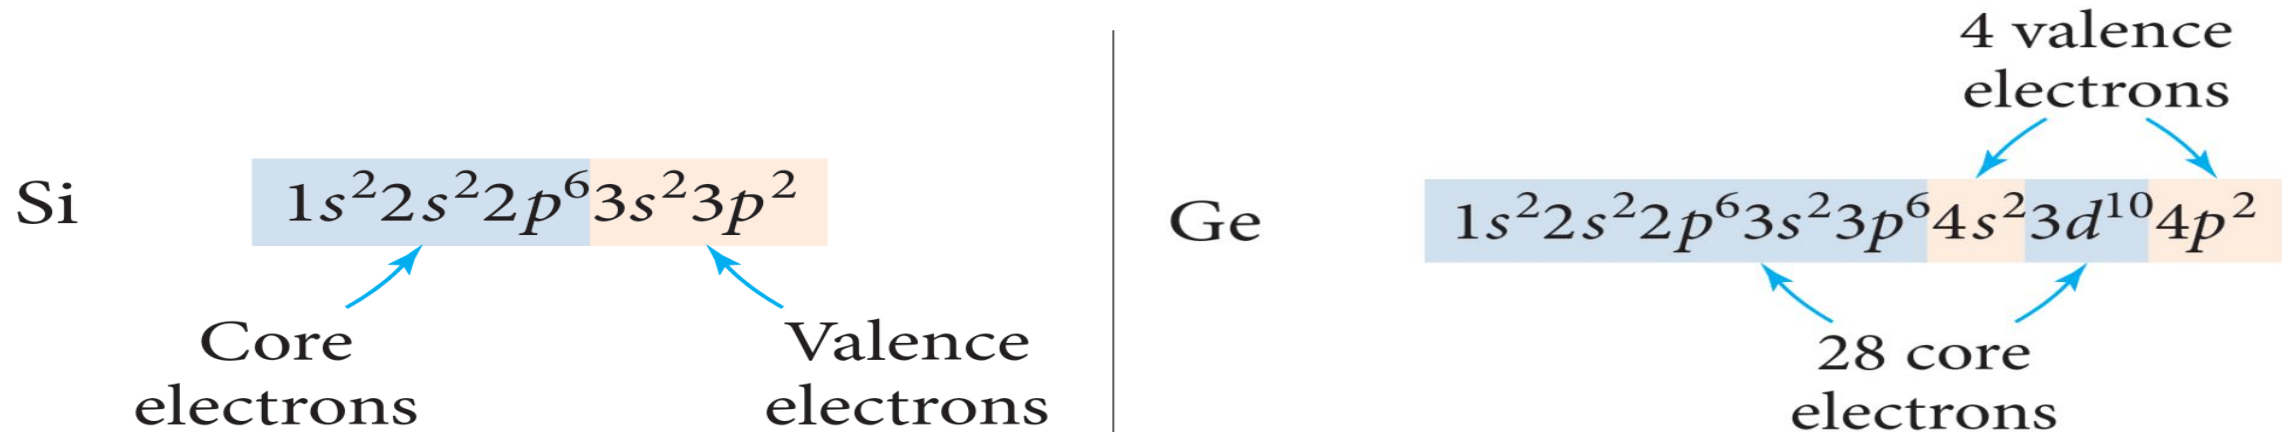

2.11 Electron Configurations: Valence Electrons & Core Electrons

- **Valence Electrons:** electrons in all the sublevels within the highest principal energy level (n).
 - ✓ One of the most important factors in the way an atom behaves, both chemically and physically, is the number of its “valence electrons”.
 - ✓ The highest principal energy level is also known as “the valence shell”
 - ✓ Valence electrons in atoms participate in:
 - ✓ Bonding
 - ✓ Making cations (by losing e^-)
 - ✓ Making anions (by gaining e^-)
- **Core Electrons:** electrons in all lower energy levels (i.e. all shells except the valence shell).

2.11 Electron Configurations: Valence Electrons & Core Electrons

Example: How many valence and core electrons are in **Si** and **Ge** atoms?

Exercise: Draw the orbital diagram and indicate how many valence and core electrons are in: Ne, Kr, Al, Cl, O, F, S and Be neutral atoms (atoms in their ground states, i.e. not ions)?

Exercise: Draw the orbital diagram and indicate how many valence and core electrons are in:
Ne, Kr, Al, Cl, O, F, S and Be neutral atoms (atoms in their ground states, i.e. not ions)?

2.11 Electron Configurations: Valence Electrons & Core Electrons

Electron configurations of Ions

- The sulfur atom has 6 valence electrons:

- To have 8 valence electrons, sulfur must gain 2 more e^- forming anion:

- The magnesium atom has 2 valence electrons:

- When magnesium forms a cation, it loses its 2 valence electrons:

Assessment

Answer the following questions:

- 1- Name an element in the fourth period of the periodic table with:
 - a. five valence electrons
 - b. a complete outer shell
- 2- Write full orbital diagrams for each element:
 - a. N
 - b. F
 - c. Mg
 - d. Al
 - e. K

3- Determine the number of valence electrons in each element.

a. Ba

b. Cs

c. Ne

d. S

e. C

4- The complete electron configuration of sulfur is _____.

5- Which one of the following is the correct electron configuration for a ground-state nitrogen atom?

2.13 Periodic Trends: **Moving Across The Periodic Table**

- **Periodic Trends**: are the properties that show patterns when examined across the periodic table (i.e. when moving across periods or down the groups).
- The periodic trends of the following properties will be discussed:
 - ✓ The Effective Nuclear Charge
 - ✓ Atomic Radii (the sizes of atoms)
 - ✓ Ionic Radii (the sizes of ions)
 - ✓ Ionization Energy
 - ✓ Electron Affinities
 - ✓ Metallic Character
 - ✓ Electronegativity

2.13 Periodic Trends: **The Effective Nuclear Charge**

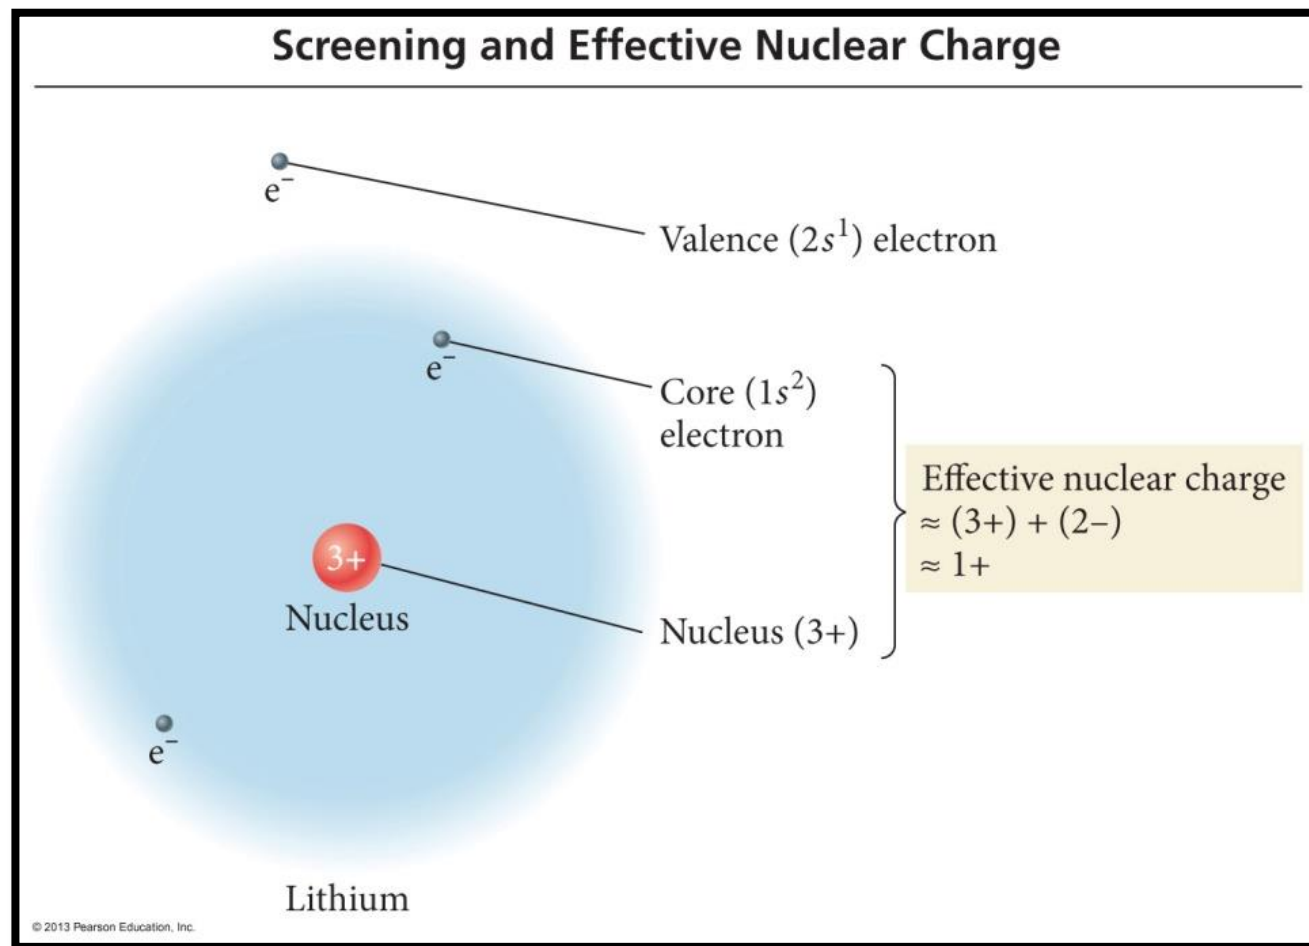

- **Effective Nuclear Charge** (Z_{eff}): It is the pull force an electron “feels” from the nucleus (protons).
 - The closer the electrons are to the nucleus, the greater the “pull” on the electrons.
 - The greater the Z_{eff} , the more tightly the electrons are held and the more energy needed to remove the electrons.
 - Electrons located farthest from the nucleus experience less Z_{eff} .
- **General trend in Z_{eff}** :
 - ✓ Z_{eff} increases going across periods.
 - ✓ Z_{eff} decreases going down groups.

$$Z_{\text{effective}} = Z - S$$

Where, **Z** is the nuclear charge, and **S** is the number of electrons in lower energy levels.

2.13 Periodic Trends: The Effective Nuclear Charge

- Z_{eff} increases across a period owing to **incomplete shielding** by inner electrons in atomic orbitals (subshells).
- Shielding ability of subshells:
 $s > p > d > f$
- Estimate Z_{eff}
 $= [Z(\text{atomic number}) - (\text{number of inner electrons})]$
 - Pull felt by **2s** electron in Li: $Z_{\text{eff}} = 3 - 2 = 1$

2.13 Periodic Trends: Atomic Radii (Sizes of Atoms)

Atomic Radius: (نصف القطر الذري)

is a term used to describe the size of the atom,

and it is one-half ($\frac{1}{2}$) the distance between the two nuclei in

two adjacent metal atoms (a)
or in a diatomic molecule (b).

Atomic Radius

➤ **Atomic Radius:** is an average radius of an atom based on measuring large numbers of molecules of elements and compounds.

- ✓ There are several methods for measuring the radius of an atom, and they give slightly different numbers.
 - ✓ Van der Waals radius = nonbonding
 - ✓ Covalent radius = bonding radius

2.13 Periodic Trends: Atomic Radii (Sizes of Atoms)

➤ General trend in atomic radii:

✓ Atomic radius decreases across period (left to right)

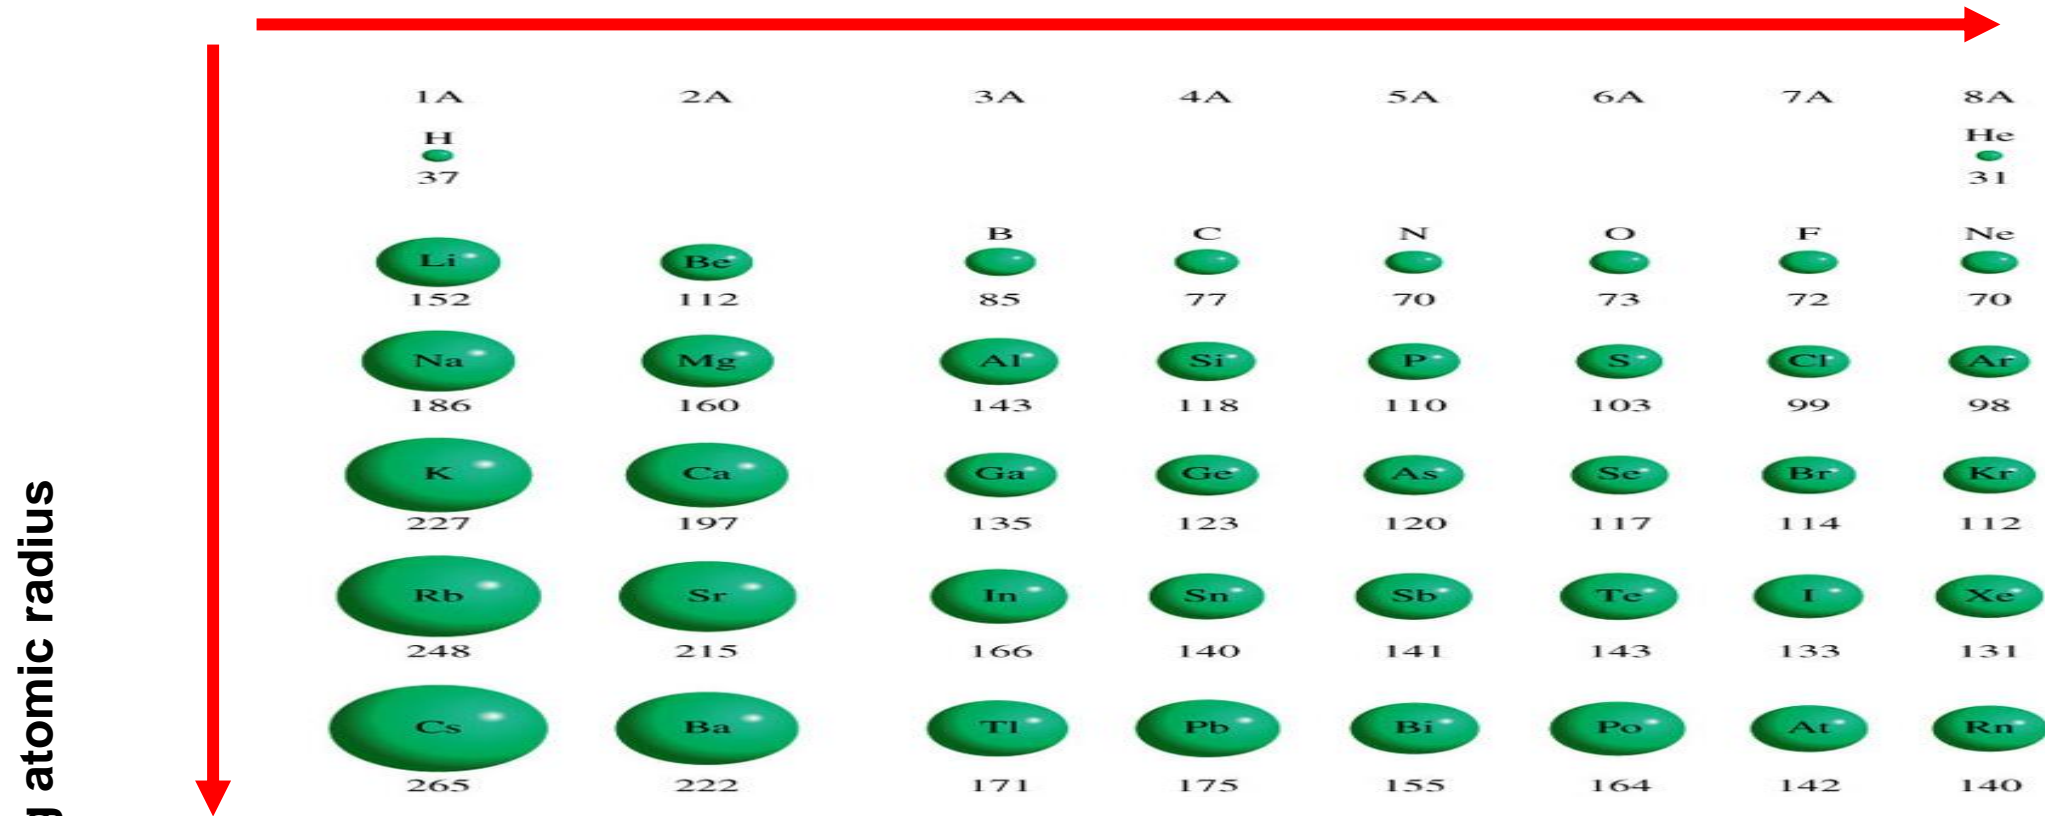

- ✓ Adding electrons to same valence shell
- ✓ Effective nuclear charge increases
- ✓ Valence shell held closer

✓ Atomic radius increases down group

- ✓ Valence shell farther from nucleus
- ✓ Effective nuclear charge fairly close

Decreasing atomic radius

2.13 Periodic Trends: **Ionic Radii (Sizes of Ions)**

- **Ionic Radius:** is the interatomic distances in ionic compounds.
- ✓ Ions in the same group have the same charge.
- ✓ Ion size increases down the column.
 - ✓ Higher valence shell, larger
- ✓ Cations are smaller than their neutral atoms.
- ✓ Anions are larger than their neutral atoms.
- ✓ Cations are smaller than anions.
 - ✓ Except Rb^+ and Cs^+ bigger or same size as F^- and O^{2-} .
- Larger positive charge = smaller cation
 - ✓ For isoelectronic species
 - ✓ Isoelectronic = same electron configuration
- Larger negative charge = larger anion
 - ✓ For isoelectronic species

2.13 Periodic Trends: Ionic Radii (Sizes of Ions)

- Metals elements lose valence electrons to form cation ions.
- Cation radii are always smaller than atomic radii.

2.13 Periodic Trends: Ionic Radii (Sizes of Ions)

- Non-metal elements gain valence electrons to form anion ions.
- Anion radii are always larger than atomic radii.

2.13 Periodic Trends: Ionic Radii (Sizes of Ions)

Trends in Ionic Size

Relative radius of some atoms vs. their ions (in angstroms \AA): \triangleright

Example:

Referring to a periodic table, arrange the following atoms in order of increasing atomic radius: P, Si, N.

Solution:

1. N & P are in the same group → N is smaller than P
2. P & Si are in the same period → P is smaller than Si

The arrangement of increasing atomic radius is:

5 B 10.81 boron	6 C 12.01 carbon	7 N 14.01 nitrogen	8 O 16.00 oxygen	9 F 18.99 fluorine
13 Al 26.98 aluminum	14 Si 28.09 silicon	15 P 30.97 phosphorus	16 S 32.07 sulfur	17 Cl 35.45 chlorine
31 Ga 69.72 gallium	32 Ge 72.61 germanium	33 As 74.92 arsenic	34 Se 78.96 selenium	35 Br 79.90 bromine

2.13 Periodic Trends: **Ionization Energy**

➤ **Ionization Energy (IE)**: the minimum energy needed to remove an electron from an atom or ion.

- ✓ Measured in gaseous state
- ✓ For endothermic process
- ✓ Valence electron easiest to remove, lowest IE:

- ✓ First ionization energy (IE_1) = energy to remove electron from a **neutral atom**.
- ✓ Second ionization energy (IE_2) = energy to remove from **+1 ion**, etc.

Increasing First Ionization Energy

Decreasing First Ionization Energy

2.13 Periodic Trends: **Ionization Energy**

➤ General trend in first ionization energy:

- ✓ First IE generally decreases down the group.
 - Valence electron farther from nucleus
- ✓ First IE generally increases across the period.
 - Effective nuclear charge increases

➤ **Factors Affecting Ionization Energy:**

1- **Nuclear charge:** the larger the nuclear charge, the greater the ionization energy.

2- **Shielding effect:** the greater the shielding effect, the less the ionization energy.

3- **Radius:** the greater the distance between the nucleus and the outer electrons of an atom, the less the ionization energy.

4- **Sublevel:** an electron from a full or half-full sublevel requires additional energy to be removed.

Example : Which atom should have a smaller first ionization energy: oxygen (O) or sulphur (S)?

Solution:

O & S are in group 6A

O: [He] 2s² 2p⁴

S: [Ne] 3s² 3p⁴

4A 14	5A 15	6A 16	7A 17	2 He 4.00 helium
6 C 12.01 carbon	7 N 14.01 nitrogen	8 O 16.00 oxygen	9 F 19.00 fluorine	10 Ne 20.18 neon
14 Si 28.09 silicon	15 P 30.97 phosphorus	16 S 32.07 sulfur	17 Cl 35.45 chlorine	18 Ar 39.95 argon
32 Ge 72.61 germanium	33 As 74.92 arsenic	34 Se 78.96 selenium	35 Br 79.90 bromine	36 Kr 83.80 krypton

The valence electrons in S are farther from the nucleus → removing of them is easier

Thus: $I_1(\text{S}) < I_1(\text{O})$

2.14 Periodic Trends: **Electron Affinities**

➤ **Electron Affinity (EA)**: is the energy change associated with the gaining of an electron by the atom in the gaseous state.

➤ EA can be either endothermic or exothermic in nature.

- Why either energy exchange?

- It is due to electron-electron repulsion within orbitals and the volume of the atom.

➤ **General trends in electron affinity:**

- EA increases across a period.

- EA becomes more positive due to increase in Z_{eff}

- EA decreases down a group.

- EA becomes less positive due to decrease in Z_{eff} .

Increasing Electron affinity

Decreasing Electron affinity

2.14 Periodic Trends: **Metallic Character**

- **Metallic Character**: is how closely an element's properties match the ideal properties of a metals.
 - More malleable and ductile, better conductors, and easier to ionize
- **General trends in metallic character**:
 - Metallic character decreases across a period.
 - ✓ Metals found at the left of the period and nonmetals to the right
 - Metallic character increases down the column.
 - ✓ Nonmetals found at the top of the middle main group elements and metals found at the bottom

Example : choose the more metallic element from following:

(a) Sn or Te

(b) P or Sb

Sn > Te

Sb > P

2.14 Periodic Trends: **Electronegativity**

➤ **Electronegativity (EN)**: is the ability of an atom in a molecule to attract electrons to itself.

- ✓ This attraction or pulling of electrons causes a separation of charge within the bond.
- ✓ Dipole moment is formed.
- ✓ The greater the difference, the more **POLAR** the bond.

➤ **General trends in electronegativity**:

- ✓ Electronegativity **increases** across a period.
- ✓ Electronegativity **decreases** down a group.

Ex-)- Which of these atom is the *most* electronegative?

A-Li

B-Al

C-P

D-O

Ex-)- Which of these elements has the *greatest* electronegativity?

A-Na

B-Mg

C - F

D-O

Ex-)- Which of these elements is the *least* electronegative?

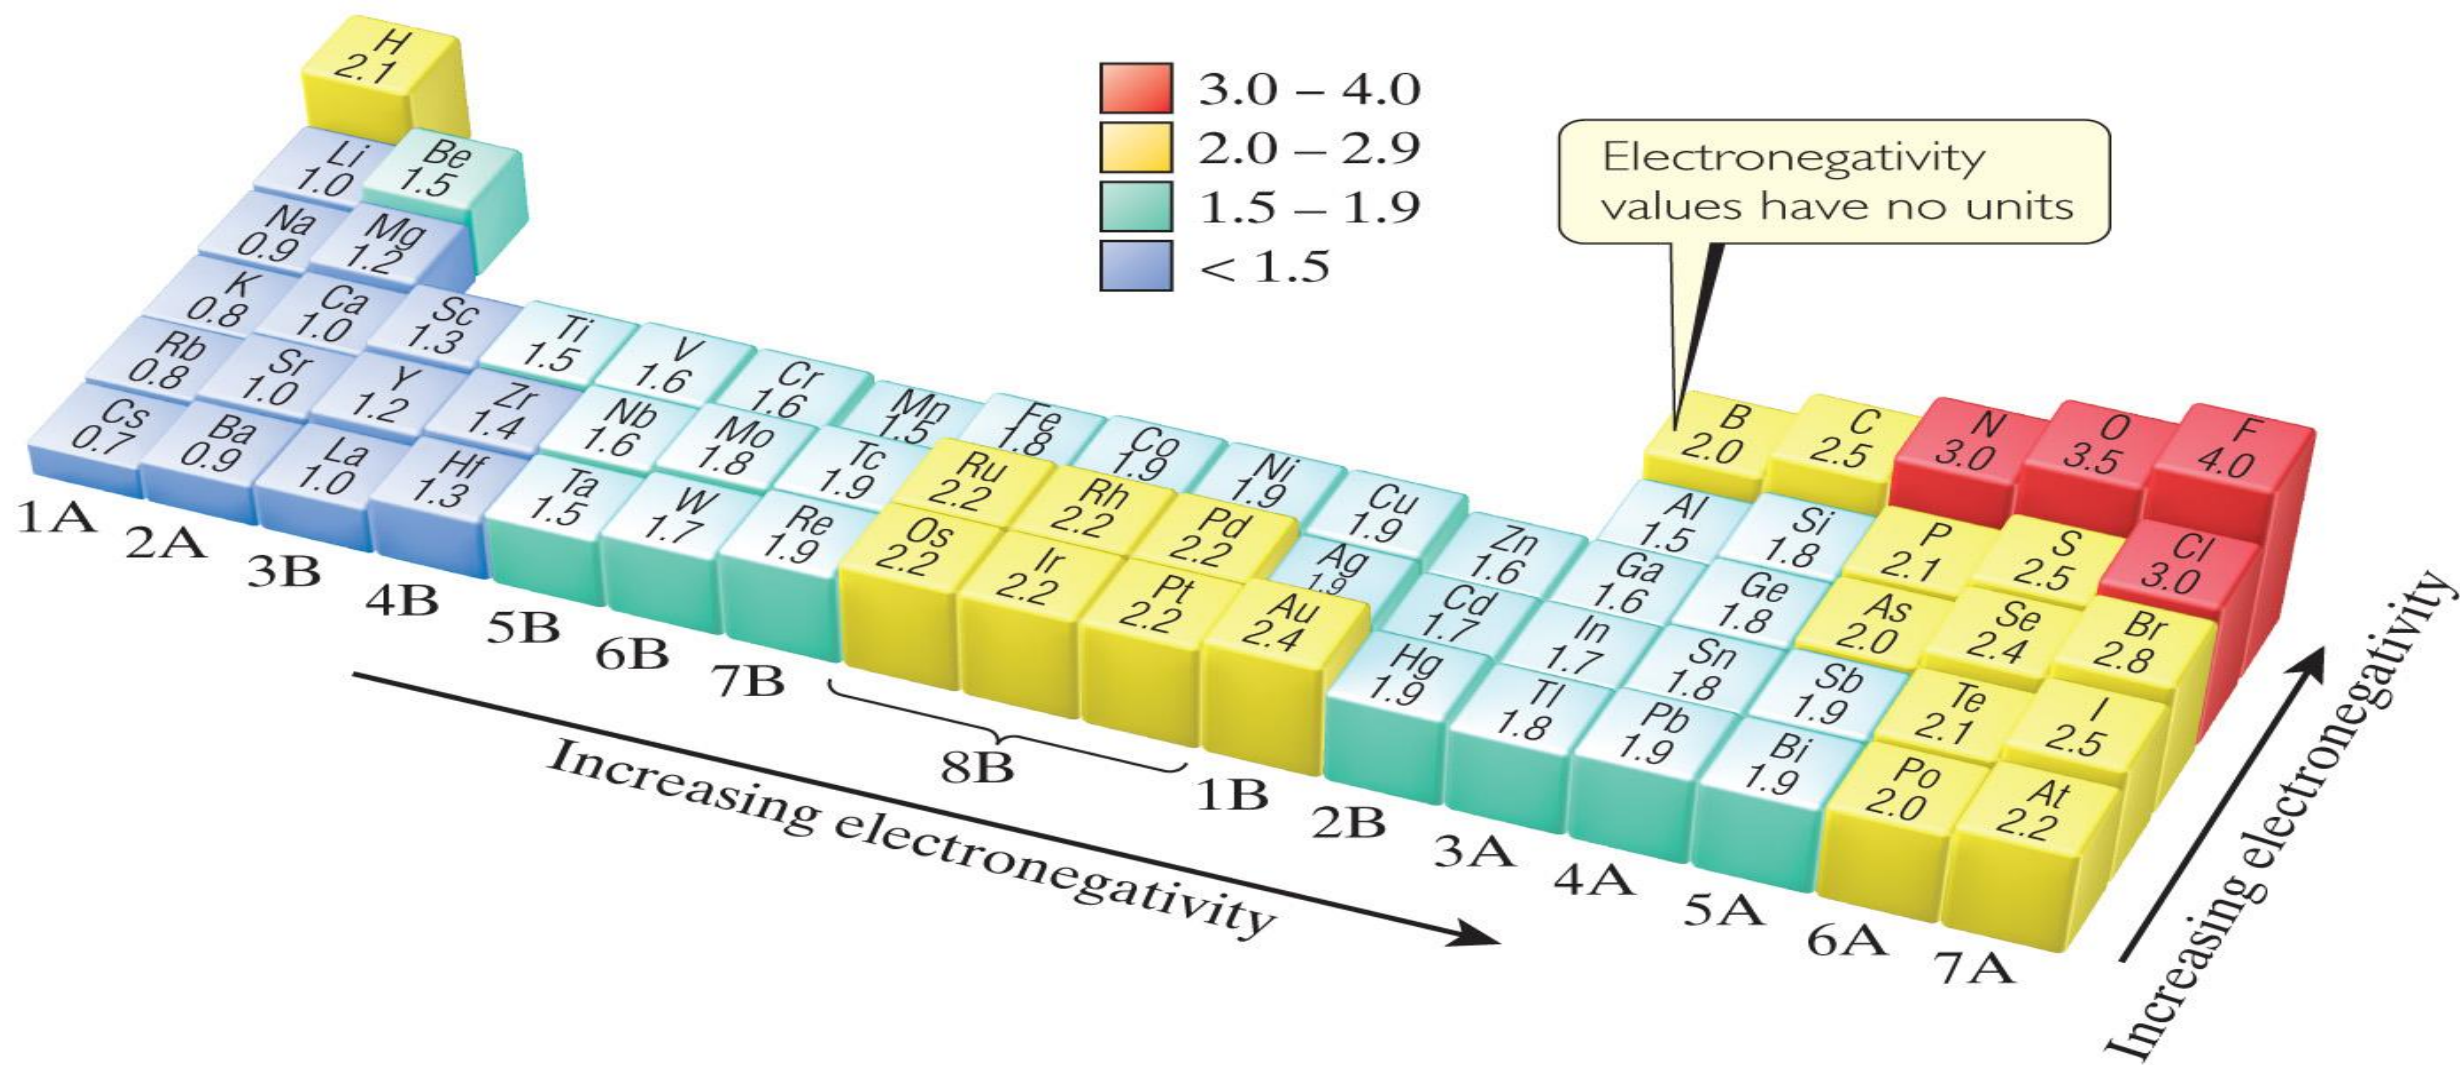

A-Li

B-Al

2.14 Periodic Trends: Electronegativity

2.14 Periodic Trends: A Summary

Review مراجعة

(1) The element that has the valance electron configuration $3s^2 3p^3$ is:

- a) Carbon
- b) Nitrogen
- c) Phosphorus
- d) Neon

(2) Titanium (Ti) element is found in the periodic table in

- a) s-block
- b) P-block
- c) d-block
- d) f-block

(3) What the electronic configuration for Co

a) [Ar] 4s² 3d⁵

b) [Ar] 4s² 3d⁷

c) [Ar] 4s¹ 3d⁶

d) [Ar] 4s² 3d⁴

**(4) Arrange the following in order of increasing first ionization energy:
F, K, P, Ca, and Ne.**

a) K < Ca < P < F < Ne

b) Ne < F < Ca < K < P

c) P < F < Ne < K < Ca

d) K < F < P < Ne < Ca

(5) Which of these elements is most likely to be a **good** conductor of electricity?

- a) N
- b) S
- c) He
- d) Fe

(6) magnesium ion, ${}_{12}\text{Mg}^{2+}$, has

- a) 12 protons and 13 electrons.
- b) 24 protons and 26 electrons.
- c) 12 protons and 10 electrons.
- d) 24 protons and 22 electrons.

Answer the following questions:

1. Arrange these elements: Mg, Na, Cl, S, Ar, Si, and P, in order of:

- a. decreasing atomic radius. b. increasing ionization energy.
c. decreasing electronegativity. d. increasing metallic character

2. Choose the more metallic element from each pair:

- a. Sr or Sb b. Be or Ba c. Ti or Cu d. S or Si

3. Choose the largest atom from each pair:

a. Al or Cl b. Si or C

c. S or Se

d. Ne or Xe

4. Arrange the elements in order of increasing atomic radius: Ca, Rb, S, Si, Ge, F.

5. Arrange these elements in order of increasing electronegativity: C, N, O, Be, B.

6. Define each term and indicate what happens for each of them when moving right to left within a period of the periodic table?

- a. Electronegativity
- b. Ionization energy
- c. Atomic radius
- d. Metallic character
- e. Electron affinity

- a. **Electronegativity** : is the ability of an atom in a molecule to attract electrons to itself.
- b. **Ionization energy**: is the minimum energy (kJ/mol) required to remove an electron from a gases atom in its ground state.
- c. **Atomic radius**
- d. **Metallic character**: is how closely an element's properties match the ideal properties of a metals.
- e. **Electron affinity**: is the negative of the energy change that occurs when an electron is accepted by an atom in the gases state to form an anion
